5 PIPERAZINE- AND PIPERIDINE-DERIVATIVES AS MELANOCORTIN RECEPTOR AGONISTS

### FIELD OF THE INVENTION

The present invention relates to melanocortin receptor agonists, and more particularly piperazine and piperidine derivatives as melanocortin receptor agonists, which  
10 are useful for the treatment or prevention of diseases and disorders responsive to the activation of melanocortin receptors.

### BACKGROUND OF THE INVENTION

Pro-opiomelanocortin (POMC) derived peptides are known to affect food  
15 intake. Several lines of evidence support the notion that the G-protein coupled receptors (GPCRs) of the melanocortin receptor (MC-R) family, several of which are expressed in the brain, are targets of POMC derived peptides involved in the control of food intake and metabolism.

Evidence for the involvement of MC-R in obesity includes: i) the agouti (AVY)  
20 mouse which ectopically expresses an antagonist of the MC-1R, MC-3R and MC-4R is obese, indicating that blocking the action of these three MC-Rs can lead to hyperphagia and metabolic disorders; ii) MC-4R knockout mice (Huszar et al., *Cell*, 88:131-141, 1997) recapitulate the phenotype of the agouti mouse and these mice are obese; iii) the cyclic heptapeptide MC-1R, MC-3R, MC-4R, and MC-5R agonist melanotanin-II (MT-II) injected  
25 intracerebroventricularly (ICV) in rodents, reduces food intake in several animal feeding models (NPY, *ob/ob*, agouti, fasted) while ICV injected SHU-9119 (MC-3R, MC-4R antagonist; MC-1R and MC-5R agonist) reverses this effect and can induce hyperphagia; and iv) chronic intraperitoneal treatment of Zucker fatty rats with an  $\alpha$ -NDP-MSH derivative

-2-

5 (HP228) has been reported to activate MC-1R, MC-3R, MC-4R and MC-5R and to attenuate food intake and body weight gain over a 12 week period.

Five MC-Rs have thus far been identified, and these are expressed in different tissues. MC-1R was initially characterized by dominant gain of function mutations at the extension locus, affecting coat color by controlling phaeomelanin to eumelanin conversion through control of tyrosinase. MC-1R is mainly expressed in melanocytes. MC-2R is expressed in the adrenal gland and represents the ACTH receptor. MC-3R is expressed in the brain, gut and placenta and may be involved in the control of food intake and thermogenesis. MC-4R is uniquely expressed in the brain and its inactivation was shown to cause obesity.

(A. Kask, et al., "Selective antagonist for the melanocortin-4-receptor (HS014) increases food intake in free-feeding rats, *Biochem. Biophys. Res. Commun.*, 245:90-93, 1998). MC-5R is expressed in many tissues including white fat, placenta and exocrine glands. A low level of expression is also observed in the brain. MC-5R knock out mice reveal reduced sebaceous gland lipid production (Chen et al., *Cell*, 91:789-798, 1997).

MC-4R appears to play role in other physiological functions as well, namely controlling grooming behavior, erection and blood pressure. Erectile dysfunction denotes the medical condition of inability to achieve penile erection sufficient for successful intercourse. The term "impotence" is often times employed to describe this prevalent condition.

Synthetic melanocortin receptor agonists have been found to initiate erections in men with psychogenic erectile dysfunction (H. Wessells et al., "Synthetic Melanotropic Peptide Initiates Erections in Men With Psychogenic Erectile Dysfunction: Double-Blind, Placebo Controlled Crossover Study," *J. Urol.*, 160: 389-393, 1998). Activation of melanocortin receptors of the brain appears to cause normal stimulation of sexual arousal. Evidence for the involvement of MC-R in male and/or female sexual dysfunction is detailed in WO 00/74670.

Diabetes is a disease in which a mammal's ability to regulate glucose levels in the blood is impaired because the mammal has a reduced ability to convert glucose to glycogen for storage in muscle and liver cells. In Type I diabetes, this reduced ability to store glucose is caused by reduced insulin production. "Type II Diabetes" or "non-insulin dependent diabetes mellitus" (NIDDM) is the form of diabetes, which is due to a profound

-3-

5 resistance to insulin stimulating or regulatory effect on glucose and lipid metabolism in the main insulin-sensitive tissues, muscle, liver and adipose tissue. This resistance to insulin responsiveness results in insufficient insulin activation of glucose uptake, oxidation and storage in muscle and inadequate insulin repression of lipolysis in adipose tissue and of glucose production and secretion in liver. When these cells become desensitized to insulin,

10 the body tries to compensate by producing abnormally high levels of insulin and hyperinsulemia results. Hyperinsulemia is associated with hypertension and elevated body weight. Since insulin is involved in promoting the cellular uptake of glucose, amino acids and triglycerides from the blood by insulin sensitive cells, insulin insensitivity can result in elevated levels of triglycerides and LDL which are risk factors in cardiovascular diseases.

15 The constellation of symptoms which includes hyperinsulemia combined with hypertension, elevated body weight, elevated triglycerides and elevated LDL is known as Syndrome X.

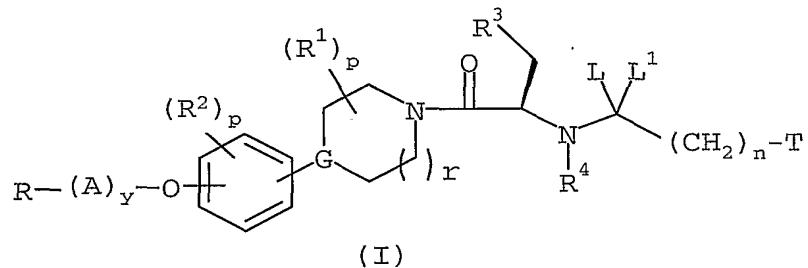

Spiropiperidine and piperidine derivates have been disclosed in U.S. Pat. No. 6,294,534 B1, WO 01/70337, WO 00/74679 and WO 01/70708 as agonists of melanocortin receptor(s), which can be used for the treatment of diseases and disorders, such as obesity, diabetes and sexual dysfunction.

In view of the unresolved deficiencies in treatment of various diseases and disorders as discussed above, it is an object of the present invention to provide novel piperazine derivatives, which are useful as melanocortin receptor agonists to treat obesity, diabetes, and male and female sexual dysfunction.

10       The compound of formula I is preferably formulated in a unit dosage form prior to administration. Accordingly the present invention also includes a pharmaceutical composition comprising a compound of formula I and a suitable pharmaceutical carrier.

The present pharmaceutical compositions are prepared by known procedures using well-known and readily available ingredients. In making the formulations of the 15 present invention, the active ingredient (a compound of formula I) is usually mixed with a carrier, or diluted by a carrier, or enclosed within a carrier, which may be in the form of a capsule, sachet, paper or other container. When the carrier serves as a diluents, it may be a solid, semisolid or liquid material which acts as a vehicle, excipient or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, 20 sachets, cachets, elixirs, suspensions, emulsions, solutions, syrups, aerosol (as a solid or in a liquid medium), soft and hard gelatin capsules, suppositories, sterile injectable solutions and sterile packaged powders.

-53-

5 Some examples of suitable carriers, excipients, and diluents include lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin, calcium silicate, microcrystalline cellulose, polyvinylpyrrolidone, cellulose, water syrup, methyl cellulose, methyl and propylhydroxybenzoates, talc, magnesium stearate and mineral oil. The formulations can additionally include lubricating  
10 agents, wetting agents, emulsifying and suspending agents, preserving agents, sweetening agents or flavoring agents. The compositions of the invention may be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to the patient.

15 Dosage:

The specific dose administered is determined by the particular circumstances surrounding each situation. These circumstances include, the route of administration, the prior medical history of the recipient, the pathological condition or symptom being treated, the severity of the condition/symptom being treated, and the age and sex of the recipient.  
20 Additionally, it would be understood that the therapeutic dosage administered can be determined by the physician in the light of the relevant circumstances.

Generally, an effective minimum daily dose of a compound of formula I is about 1, 5, 10, 15, or 20 mg. Typically, an effective maximum dose is about 500, 100, 60, 50, or 40 mg. The suitable dose may be determined in accordance with the standard practice  
25 in the medical arts of "dose titrating" the recipient, which involves administering a low dose of the compound initially and then gradually increasing the does until the desired therapeutic effect is observed.

Route of Administration

30 The compounds may be administered by a variety of routes including the oral, rectal, transdermal, subcutaneous, topical, intravenous, intramuscular or intranasal routes.

Combination Therapy

Compounds of formula I may be used in combination with other drugs that are used in the treatment of the diseases or conditions for which compounds of formula I are

Biological Assays

A. Binding Assay:

The radioligand binding assay is used to identify competitive inhibitors of  
20       $^{125}$ I-NDP- $\alpha$ -MSH binding to cloned human MCRs using membranes from stably transfected human embryonic kidney (HEK) 293 cells.

HEK 293 cells transfected with human or rat melanocortin receptors are grown either as adherent monolayers or suspension culture. Monolayer cells are grown in roller bottle cultures at 37°C and 5% CO<sub>2</sub>/air atmosphere in a 3:1 mixture of Dulbecco's modified Eagle medium (DMEM) and Ham's F12 containing 25 mM L-glucose, 100 units/ml penicillin G, 100 microgram/ml streptomycin, 250 nanogram/ml amphotericin B, 300 microgram/ml gentamicin and supplemented with 5% fetal bovine serum. Monolayer cells are adapted to suspension culture (Berg et al., *Biotechniques* Vol. 14, No.6, 1993) and are grown in either spinner or shaker flasks (37°C and 7.5% CO<sub>2</sub>/air overlay) in a modified DME/F12 medium containing 0.1 mM CaCl<sub>2</sub>, 2% equine serum and 100 microgram/ml sodium heparin to prevent cell-cell aggregation. Cells are harvested by centrifugation, washed in PBS, and pellets are stored frozen at -80°C until membrane preparations.

-56-

5           The cell pellets are resuspended in 10 volumes of membrane preparation buffer (*i.e.*, 1 g pellet to 10 ml buffer) having the following composition: 50 mM Tris pH 7.5 @ 4°C, 250 mM sucrose, 1 mM MgCl<sub>2</sub>, Complete® EDTA-free protease inhibitor tablet (Boehringer Mannheim), and 24 micrograms/ml DNase I (Sigma, St. Louis, MO). The cells are homogenized with a motor-driven dounce using 20 strokes, and the homogenate is  
10 centrifuged at 38,000 x g at 4°C for 40 minutes. The pellets are resuspended in membrane preparation buffer at a concentration of 2.5-7.5 mg/ml and 1 milliliter aliquots of membrane homogenates are quickly frozen in liquid nitrogen and then stored at -80°C.

15           Solutions of a compound of formula I (300 picomolar to 30 micromolar) or unlabelled NDP- $\alpha$ -MSH (1 picomolar to 100 nanomolar) are added to 150 microliters of membrane binding buffer to yield final concentrations (listed in parentheses). The membrane binding buffer has the following composition: 25 mM HEPES pH 7.5; 10 mM CaCl<sub>2</sub>; 0.3% BSA). One hundred fifty microliters of membrane binding buffer containing 0.5-5.0 microgram membrane protein is added, followed by 50 nanomolar <sup>125</sup>I-NDP- $\alpha$ -MSH to final concentration of 100 picomolar. Additionally, fifty microliters of SPA beads (5 mg/ml) 20 are added and the resulting mixture is agitated briefly and incubated for 10 hours at r.t. The radioactivity is quantified in a Wallac Trilux Microplate Scintillation counter. IC<sub>50</sub> values obtained in competition assays are converted to affinity constants (K<sub>i</sub> values) using the Cheng-Prusoff equation: K<sub>i</sub>=IC<sub>50</sub>/(1 + D/K<sub>d</sub>).

25           B. Functional Assay:

Functional cell based assays are developed to discriminate agonists and antagonists.

30           Agonist Assay: HEK 293 cells stably expressing a human melanocortin receptor (see *e.g.*, Yang, et al., *Mol-Endocrinol.*, 11(3): 274-80, 1997) are dissociated from tissue culture flasks using a trypsin/EDTA solution(0.25%; Life Technologies, Rockville, MD). Cells are collected by centrifugation and resuspended in DMEM (Life Technologies, Rockville, MD) supplemented with 1% L-glutamine and 0.5% fetal bovine serum. Cells are counted and diluted to 4.5x10<sup>5</sup>/ml.

-57-

5           A compound of formula I is diluted in dimethylsulfoxide (DMSO) ( $3 \times 10^{-5}$  to  $3 \times 10^{-10}$  M final concentrations) and 0.05 volume of compound solution is added to 0.95 volumes of cell suspension; the final DMSO concentration is 0.5%. After incubation at 37°C/5% CO<sub>2</sub> for 5 hours, cells are lysed by addition of luciferin solution (50 mM Tris, 1 mM MgCl<sub>2</sub>, 0.2 % Triton-X100, 5 mM DTT, 500 micromolar Coenzyme A, 150 micromolar 10 ATP, and 440 micromolar luciferin) to quantify the activity of the reporter gene luciferase, an indirect measurement of intracellular cAMP production.

15           Luciferase activity is measured from the cell lysate using a Wallac Victor 2 luminometer. The amount of lumen production which results from a compound of formula I is compared to that amount of lumens produced in response to NDP- $\alpha$ -MSH, defined as a 100% agonist, to obtain the relative efficacy of a compound. The EC<sub>50</sub> is defined as the compound concentration that results in half maximal stimulation, when compared to its own maximal level of stimulation.

20           Antagonist assay: Antagonist activity is defined as the ability of a compound to block lumen production in response to NDP- $\alpha$ -MSH. Concentration-response curves are generated for NDP- $\alpha$ -MSH in the absence and presence of a fixed concentration of a solution of a compound of formula I ( $10 \times K_i$  from binding assays). Suspensions of MCR-expressing cells are prepared and are incubated with NDP- $\alpha$ -MSH and compound solutions for 5 hours as described above. The assay is terminated by the addition of luciferin reagent and lumen production is quantified. Antagonist potency is determined from the rightward shift of the 25 EC<sub>50</sub> value in the absence of a compound of formula I using the equation:  $K_b = \text{Concentration of Antagonist}/[(EC_{50}^{'}/EC_{50}) - 1]$ .

Whole Cell cAMP Accumulation Assay

Compound Preparation

30           In the agonist assay, compounds are prepared as 10mM and NDP-alpha-MSH (control) as 33.3  $\mu$ M stock solutions in 100 % DMSO. These are serially diluted in 100 % DMSO. The compound plate is further diluted 1:200 in compound dilution buffer (HBSS-092, 1 mM Ascorbic Acid, 1 mM IBMX, 0.6% DMSO, 0.1% BSA). The final concentration

-58-

5 range being 10 µM–100 pM for compound and 33.33 nM–0.3 pM for control in 0.5 % DMSO. Transfer 20 µl from this plate into four PET 96-well plates (all assays are performed in duplicate for each receptor).

#### Cell Culture and Cell Stimulation

HEK 293 cells stably transfected with the MC3R and MC4R were grown in  
10 DMEM containing 10% FBS and 1%Antibiotic/Antimycotic Solution. On the day of the assay the cells were dislodged with enzyme free cell dissociation solution and resuspended in cell buffer (HBSS-092, 0.1% BSA, 10 mM HEPES) at 1 x e6 cells/ml. Add 40µl of cells/well to the PET 96-well plates containing 20 microliter diluted compound and control. Incubate @ 37°C in a water bath for 20 minutes. Stop the assay by adding 50µl Quench  
15 Buffer (50 mM Na Acetate, 0.25% Triton X-100).

#### Radioligand Binding Assays

Radioligand binding assays were run in SPA buffer (50mM Sodium Acetate, 0.1% BSA). The beads, antibody and radioligand were diluted in SPA buffer to provide sufficient volume for each 96-well plate. To each quenched assay well was added 100  
20 microliter cocktail containing 33.33 microliter of beads, 33.33 microliter antibody and 33.33 microliter <sup>125</sup>I-cAMP. This was based on a final concentration of 6.3 mg/ml beads, 0.65% anti-goat antibody and 61 pM of <sup>125</sup>I-cAMP (containing 25000-30000 CPM) in a final assay volume of 210 microliter. The plates were counted in a Wallac MicroBeta counter after a 12-hour incubation.

25 The data was converted to pmoles cAMP using a standard curve assayed under the same conditions. The data was analyzed using Activity Base software to generate agonist potencies (EC50) and percent relative efficacy data to NDP-alpha-MSH.

#### C. In vivo Food Intake Models:

30 1) Daily food intake. Male Long-Evans rats are injected intracerebroventricularly (ICV) with a test compound in 5 microliters of 50% propylene glyco/artificial cerebrospinal fluid one hour prior to onset of dark cycle (12 hours). Food

-59-

5 intake is determined by subtracting the food weight remaining after 24 hours from food weight just prior to ICV injection.

10 2) Acute Calorimetry. Male Long-Evans rats are administered test compound by subcutaneous injection, intramuscular injection, intravenous injection, intraperitoneal injection, ICV injection or by oral gavage between 0 and 5 hours after the onset of the dark cycle. Rats are placed into a calorimetry chamber and the volume of oxygen consumed and volume of carbon dioxide exhaled are measured each hour for 24 hours. Food intake is measured for the 24 hour period as described in C.1). Locomoter activity is measured when the rat breaks a series of infrared laser beams when in the calorimeter. These measurements permit calculation of energy expenditure, respiratory quotient and energy balance.

15 3) Food intake in diet induced obese mice. Male C57/B16J mice maintained on a high fat diet (60% fat calories) for 6.5 months from 4 weeks of age are dosed intraperitoneally with a compound of formula I. Food intake and body weight are measured over an eight day period. Biochemical parameters relating to obesity, including leptin, insulin, triglyceride, free fatty acid, cholesterol and serum glucose levels are determined.

20 D. Rat Ex Copula Assay:

25 Sexually mature male Caesarian Derived Sprague Dawley (CD) rats (over 60 days old) are used with the suspensory ligament surgically removed to prevent retraction of the penis back into the penile sheath during the ex copula evaluations. Animals receive food and water *ad lib* and are kept on a normal light/dark cycle. Studies are conducted during the light cycle.

30 1) Conditioning to Supine Restraint for Ex Copula Reflex Tests. This conditioning takes about 4 days. Day 1, the animals are placed in a darkened restrainer and left for 15 - 30 minutes. Day 2, the animals are restrained in a supine position in the restrainer for 15 - 30 minutes. Day 3, the animals are restrained in the supine position with the penile sheath retracted for 15 - 30 minutes. Day 4, the animals are restrained in the supine position with the penile sheath retracted until penile responses are observed. Some animals require additional days of conditioning before they are completely acclimated to the

-60-

5 procedures; non-responders are removed from further evaluation. After any handling or evaluation, animals are given a treat to ensure positive reinforcement.

2) Ex Copula Reflex Tests. Rats are gently restrained in a supine position with their anterior torso placed inside a cylinder of adequate size to allow for normal head and paw grooming. For a 400-500 gram rat, the diameter of the cylinder is approximately 8  
10 cm. The lower torso and hind limbs are restrained with a non-adhesive material (vetrap). An additional piece of vetrap with a hole in it, through which the glans penis will be passed, is fastened over the animal to maintain the preputial sheath in a retracted position. Penile responses will be observed, typically termed *ex copulu* genital reflex tests. Typically, a series of penile erections will occur spontaneously within a few minutes after sheath  
15 retraction. The types of normal reflexogenic erectile responses include elongation, engorgement, cup and flip. An elongation is classified as an extension of the penile body. Engorgement is a dilation of the glans penis. A cup is defined as an intense erection where the distal margin of the glans penis momentarily flares open to form a cup. A flip is a dorsiflexion of the penile body.

20 Baseline and/or vehicle evaluations are conducted to determine how and if an animal will respond. Some animals have a long duration until the first response while others are non-responders altogether. During this baseline evaluation, latency to first response time, number and type of responses are recorded. The testing time frame is 15 minutes after the first response.

25 After a minimum of 1 day between evaluations, these same animals are administered a compound of formula I at 20 mg/kg and evaluated for penile reflexes. All evaluations are videotaped and scored later. Data are collected and analyzed using paired 2 tailed t-tests to compare baseline and/or vehicle evaluations to drug treated evaluations for individual animals. Groups of a minimum of 4 animals are utilized to reduce variability.

30 Positive reference controls are included in each study to assure the validity of the study. Animals can be dosed by a number of routes of administration depending on the nature of the study to be performed. The routes of administration includes intravenous (IV), intraperitoneal (IP), subcutaneous (SC) and intracerebral ventricular (ICY).

5    E. Models of Female Sexual Dysfunction:

Rodent assays relevant to female sexual receptivity include the behavioral model of lordosis and direct observations of copulatory activity. There is also a urethrogenital reflex model in anesthetized spinally transected rats for measuring orgasm in both male and female rats. These and other established animal models of female sexual dysfunction are described in McKenna, et al., *Am. J. Physiol.*, (Regulatory Integrative Comp. Physiol 30):R1276-R1285, 1991; McKenna, et al., *Pharm. Bioch. Behav.*, 40:151-156, 1991; and Takahashi, et al., *Brain Res.*, 359:194-207, 1985.

Preparation of the Compounds of the Invention

15       Preparation of the compounds of the present invention may be carried out via sequential or convergent synthetic routes. The skilled artisan will recognize that, in general, the three domains of a compound of formula I are connected via amide bonds. The B and C domains are optionally connected via a reduced or partially reduced amide bond (*e.g.*, via reductive amination). The skilled artisan can, therefore, readily envision numerous routes 20 and methods of connecting the three domains via standard peptide coupling reaction conditions.

The phrase "standard peptide coupling reaction conditions" means coupling a carboxylic acid with an amine using an acid activating agent such as EDC, dicyclohexylcarbodiimide, and benzotriazol-1-yloxytris (dimethylamino)phosphonium 25 hexafluorophosphate in a inert solvent such as DCM in the presence of a catalyst such as HOBT. The uses of protective groups for amine and carboxylic acids to facilitate the desired reaction and minimize undesired reactions are well documented. Conditions required to remove protecting groups which may be present can be found in Greene, *et al.*, *Protective Groups in Organic Synthesis*, John Wiley & Sons, Inc., New York, NY 1991.

30       CBZ, Boc or FMOC protecting groups are used extensively in the synthesis, and their removal conditions are well known to those skilled in the art. For example, removal of CBZ groups can be achieved by catalytic hydrogenation with hydrogen in the presence of a noble metal or its oxide such as palladium on activated carbon in a protic solvent such as ethanol. In cases where catalytic hydrogenation is contraindicated by the

-62-

5 presence of other potentially reactive functionality, removal of CBZ can also be achieved by treatment with a solution of hydrogen bromide in acetic acid, or by treatment with a mixture of TFA and dimethylsulfide. Removal of Boc protecting groups is carried out in a solvent such as methylene chloride, methanol or ethyl acetate with a strong acid, such as TFA or HCl or hydrogen chloride gas.

10 The compounds of formula I, when exist as a diastereomeric mixture, may be separated into diastereomeric pairs of enantiomers by fractional crystallization from a suitable solvent such as methanol, ethyl acetate or a mixture thereof. The pair of enantiomers thus obtained may be separated into individual stereoisomers by conventional means by using an optically active acid as a resolving agent. Alternatively, any enantiomer of a

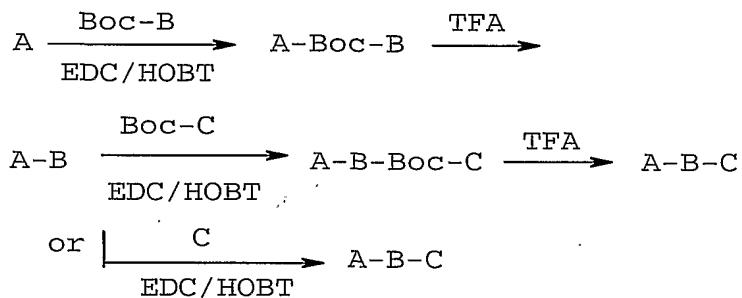

15 compound of the formula I may be obtained by stereospecific synthesis using optically pure starting materials or reagents of known configuration.

The compounds of the present invention can be prepared according to the procedure of the following schemes and examples, which may further illustrate details for the preparation of the compounds of the present invention. The compounds illustrated in the 20 examples are, however, not to be construed as forming the only genus that is considered as the present invention.

### Procedure 3

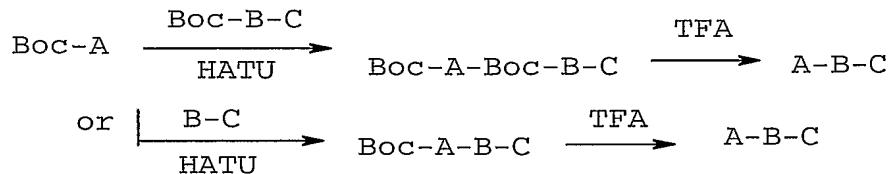

### Procedure 4

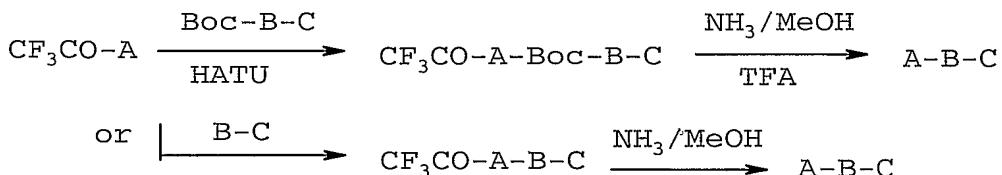

-64-

**Procedure 5**

**Procedure 6**

In coupling procedure 1, an appropriate A domain (e.g., piperazine) is coupled to B domain (e.g., D-Boc-p-Cl-Phe-OH) in the presence of EDC/HOBt followed by Boc deprotection in the presence of TFA. The coupled AB compound is then coupled to an appropriate C domain followed by deprotection of Boc group and salt formation.

Alternatively, when C domain is not protected with Boc group, the final compound can be obtained without the deprotection step.

In coupling procedure 2, an appropriate A domain (e.g., piperazine) is coupled to an appropriate BC domain in the presence of HATU followed by deprotection of Boc group in the presence of TFA and salt formation. Alternatively, when BC domain is not protected with Boc group, the final compound can be obtained without the deprotection step.

In coupling procedure 3, an appropriate A domain is coupled to an appropriate BC domain in the presence of EDC/HOBt followed by deprotection of Boc group in the presence of TFA and salt formation.

In coupling procedure 4, an appropriate AB domain is coupled to an appropriate C domain in the presence of EDC/HOBt followed by deprotection of Boc group in the presence of TFA and salt formation. Alternatively, when C domain is not protected with Boc group, the final compound can be obtained without the deprotection step.

-65-

5           In coupling procedure 5, an appropriate A domain is coupled to an appropriate BC domain (protected or non-protected BC domain) in the presence of HATU followed by deprotection of Boc group in the presence of TFA and salt formation

10          In coupling procedure 6, an appropriate A domain is coupled to an appropriate BC domain (protected or non-protected BC domain) in the presence of HATU followed by deprotection of CF<sub>3</sub>CO group in the presence of NH<sub>3</sub>/MeOH and salt formation. Coupling procedure 6 is preferred to prepared piperidine derivatives of the present invention.

15          Alternatively, EDC/HOAT, EDC/HOBt or DCC/HOBt can be used when A domain is coupled with B domain.

20          Generally, the starting material of Boc-protected piperazine (A domain) can be deprotected in the presence of TFA/CH<sub>2</sub>Cl<sub>2</sub>, HCl/EtOAc, HCl/dioxane, or HCl in MeOH/Et<sub>2</sub>O with or without a cation scavenger, such as dimethyl sulfide (DMS) before being subjected to the coupling procedure. It can be freebased before being subjected to the coupling procedure or in some cases used as the salt.

25          A suitable solvent such as CH<sub>2</sub>Cl<sub>2</sub>, DMF, THF or a mixture of the above solvents can be used for the coupling procedure. Suitable base includes triethyl amine (TEA), diisopropylethyl amine (DIPEA), N-methylmorpholine, collidine, or 2,6-lutidine. Base may not be needed when EDC/HOBt is used.

30          Generally after the reaction is completed, the reaction mixture can be diluted with an appropriate organic solvent, such as EtOAc, CH<sub>2</sub>Cl<sub>2</sub>, or Et<sub>2</sub>O, which is then washed with aqueous solutions, such as water, HCl, NaHSO<sub>4</sub>, bicarbonate, NaH<sub>2</sub>PO<sub>4</sub>, phosphate buffer (pH 7), brine or any combination thereof. The reaction mixture can be concentrated and then be partitioned between an appropriate organic solvent and an aqueous solution. The reaction mixture can be concentrated and subjected to chromatography without aqueous workup.

35          Protecting group such as Boc or CBZ, FMOC, CF<sub>3</sub>CO and H<sub>2</sub>/Pd-C can be deprotected in the presence of TFA/CH<sub>2</sub>Cl<sub>2</sub>, HCl/EtOAc, HCl/ dioxane, HCl in MeOH/Et<sub>2</sub>O, NH<sub>3</sub>/MeOH, TBAF or H<sub>2</sub>/Pd-C with or without a cation scavenger, such as thioanisole, ethane thiol and dimethyl sulfide (DMS). The deprotected amines can be used as the

-66-

5 resulting salt or are freebased by dissolving in CH<sub>2</sub>Cl<sub>2</sub> and washing with aqueous bicarbonate or aqueous NaOH. The deprotected amines can also be freebased by SCX ion exchange chromatography.

The compounds of the present invention can be prepared as salt, such as TFA, hydrochloride or succinate salts by using known standard methods.

5 The present invention also provides a novel process for preparing certain intermediates and/or compounds of the invention as shown in Reaction Schemes 3-5.

Reaction Scheme 3:

10 As shown in Reaction Scheme 3, a convergent synthesis of a key intermediate isoindoline (5) via a Heck coupling, followed by a reductive amination, a ring cyclization and a resolution has been developed. Also, alternate asymmetric approaches including asymmetric Michael addition and asymmetric hydrogenation have also been developed to prepare compounds of the invention and/or intermediates thereof.

15 As shown in Reaction Scheme 3, the isoindoline compounds of the present invention may be prepared from 2-halobenzaldehyde 1 or substituted analog thereof. Preferred starting material is 2-bromobenzaldehyde or substituted analog thereof. Pd-

5 mediated Heck coupling of 2-bromobenzaldehydes 1 with for example, methyl acrylate, provided alpha,beta-unsaturated methyl esters 2, which undergoes reductive amination to give amines, 3 (or carbamates where R<sub>1</sub> is for example, Boc). Various Heck coupling reagents and conditions were found suitable to effect the coupling reaction. Suitable catalysts and ligands include Pd(OAc)<sub>2</sub>/PPh<sub>3</sub>, Pd(OAc)PPh<sub>3</sub>/Bu<sub>4</sub>NBr, Pd(PPH<sub>3</sub>)<sub>2</sub>Cl<sub>2</sub>/CUI,  
10 Pd(OAc)<sub>2</sub>/P(O-Tol)<sub>3</sub>. Suitable solvent or solvent systems for the Heck coupling reaction include DMF, toluene and ethyl acetate. More preferred base is triethylamine.

Reductive amination of the aldehyde functionality of 2 to amines is accomplished in good yields by reaction with benzylamine or alpha-methylbenzylamine in acidic conditions, followed by *in situ* reduction of the incipient imines with NaCNBH<sub>3</sub> at  
15 about pH 5. Other reducing agents including Na(OAc)<sub>3</sub>BH and NaBH<sub>4</sub>/H may also be used to effect reduction of the incipient imines. Interestingly, the resulting amines immediately cyclized to the isoindoline compounds under the same acidic conditions for the reduction. Direct preparation of compound 4 may also be effected by use of BocNH<sub>2</sub> instead of benzylamine in the reductive amination step. Screening of various reducing agents  
20 demonstrated that the combination of Et<sub>3</sub>SiH and TFA in CH<sub>3</sub>CN represents the preferred method for effecting reductive amination using BocNH<sub>2</sub>.

The N-Boc isoindolinecarboxylic acid 5 may also be prepared from 3 as the carbamate, by an intra-molecular Michael addition and ester hydrolysis. The resolution of the isoindolinecarboxylic acids 4 by crystallization afforded enantio-pure compounds 5.

25 Two alternate asymmetric approaches have also been developed for the synthesis of isoindolinecarboxylic acid 5 i.e., asymmetric Michael additions and asymmetric hydrogenation. In the asymmetric Michael addition approach, alpha-methylbenzyl amine is used as a chiral auxiliary to induce the enantio-selectivity. In the asymmetric hydrogenation approach, compound 4' could be converted to 5 stereoselectively in the presence of chiral  
30 ligands.

Finally the coupling of the isoindolines 5 with the "B" domain piece, i.e., D-Cl-Phe to afford compound 6 ("BC" piece) is accomplished by standard amino acid coupling reactions such as, for example, by the use of EDC or EDCI or other activating agents in the

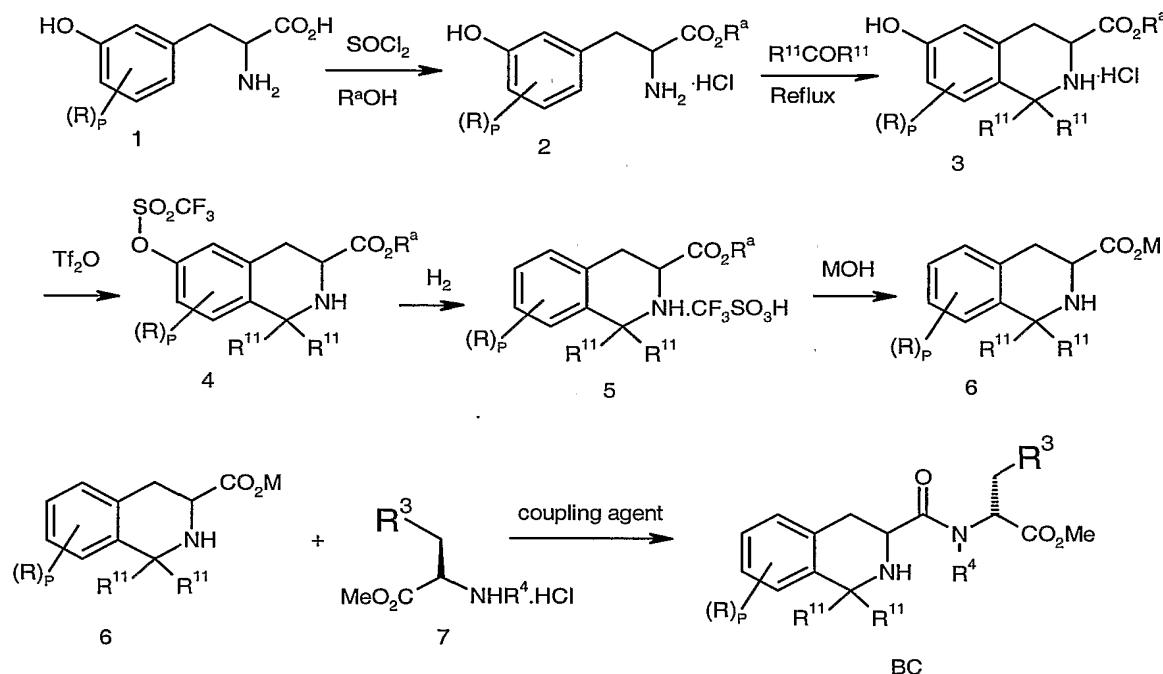

-72-

5 presence of suitable is dimethylaminopyridine (DMAP). The product (6) is then coupled with an "A" domain piece as discussed herein to afford the target MC4R agonist compound of formula I by coupling reactions known to one of skill in the art.

Preferably, the isoindole or other "C" domain piece is coupled to an "AB" coupled domain piece to form the compound of formula I.

10

Reaction Scheme 4

M = Li<sup>+</sup>, K<sup>+</sup>, Na<sup>+</sup>

15

As shown in Reaction Scheme 4, m-tyrosine ester or analogs, including substituted analogs thereof, may be esterified by forming the acid halide followed by nucleophilic displacement of halide by the alkoxy group from an alcohol, i.e., methanol or ethanol. Where thionyl chloride or other halide source is used the product may be isolated as the acid addition salt (2). The resulting ester (2) is subjected to a Pictet-Spengler reaction by heating with a suitable ketone or aldehyde in refluxing conditions. For example, an unsubstituted isoquinoline backbone (3) may be formed by employing formaldehyde in the

20

-73-

5 pictet-Spengler reaction. On the other hand, a gem-dimethyl substituted isoquinoline wherein R<sup>11</sup> is methyl, may be formed by using acetone as the ketone source and solvent. Other less reactive substituents may be substituted as the R<sup>11</sup> group for the practice of the present invention.

The product isoquinoline (3) may be isolated preferably as the acid addition salt. Where m-tyrosine is used as the starting material, the free hydroxyl group is removed first by protection/activation with a good leaving group such as, for example, reaction with triflic anhydride (trifluoromethane sulfonic anhydride) or methanesulfonic acid to form the triflate or mesylate in the presence of a base. The triflate is a preferred group used to set up the compound (3) for deoxygenation because of the extra electron withdrawing effect of the trifluoromethane substituent. The deoxygenation reaction is effected by hydrogenation at pressures of about 50psi. The product (4) may be isolated as the acid addition salt. The product (4) is hydrolyzed under basic conditions to afford the acid salt. Suitable bases for the above hydrolysis include aqueous sodium hydroxide, potassium hydroxide and sodium lithium hydroxide. The reaction is preferably performed in a mixture of aqueous and organic solvents. An exotherm during addition of base may be regulated (i.e., less than about 35°C) to avoid overheating or "runaway reactions." The reaction product may be isolated by aqueous work up. Alternatively, the entire mixture may be concentrated and washed with organic solvents to afford the desired product (6) after crystallization.

The product (6) is then reacted with a "B" domain substrate such as, for example, 4-chloro-D-phenylalanine as described previously and in the experimental section. The resulting "BC" combination product is then reacted with an "A" domain piece to form the respective compound of formula I. Alternatively, the product (6) may be reacted with an "AB" domain combination product to afford a compound of formula I.

One of skill is aware that certain protections and deprotections of intermediates in Reaction Scheme 4, to form the carbamate, substituted amine or free amine at the isoquinolinyl nitrogen are possible and contemplated as within the scope of this invention. Unless otherwise specified, reagents and procedures for effecting the reactions described herein are known to one of skill in the art and may be found in general reference

-74-

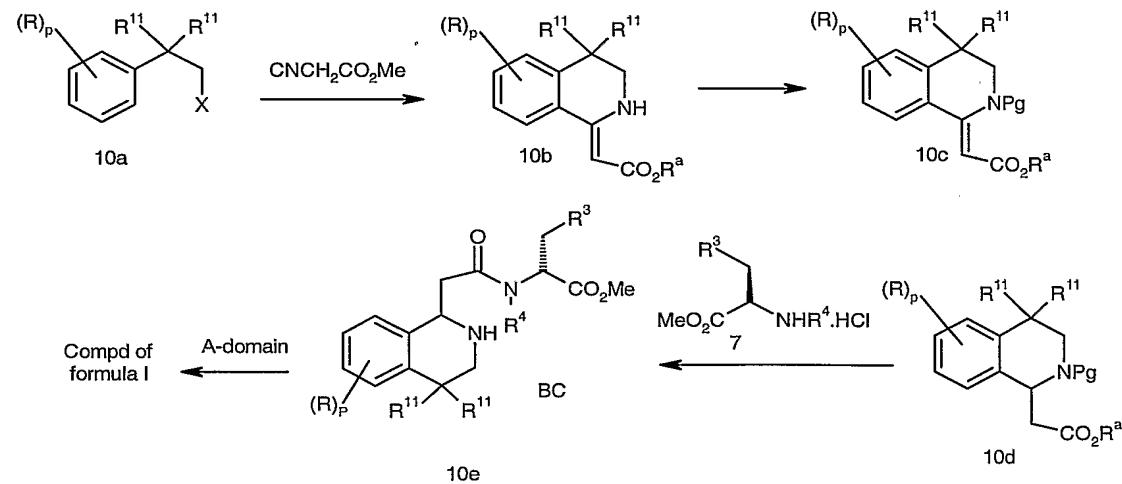

5 texts such as *Advanced Organic Chemistry* by J. March, 5<sup>th</sup> edition, Wiley Interscience Publishers, New York, NY, and references therein.

In an alternate procedure, the isoquinoline product i.e., compound (3) or (5) including their N-protected analogs may be resolved by reaction with a resolving agent such as for example, L-tartaric acid, dehydroabietylamine or other resolving agents known to one 10 of skill in the art.

Alternatively, asymmetric analogs of product (6) may be prepared by using asymmetric starting materials. For example, L-DOPA may be used in place of m-tyrosine ester in reactions essentially similar to those described and illustrated in Reaction Scheme 4 and in the examples, to afford the asymmetric analog of compound (6).

15 Tetrahydroisoquinoline acetic acid derivatives may be prepared and utilized as shown in Reaction Scheme 5 below:

Reaction Scheme 5

20

As shown in Reaction Scheme 5, a compound of formula 10a wherein X is halogen, preferably bromo or chloro, and R and R<sup>11</sup> are as defined previously, and which is obtained commercially or prepared from commercial starting materials is reacted with cyanomethyl ethyl acetate to afford a compound of formula 10b. The compound of formula

-75-

5      10b may be protected as the compound 10c with a suitable protecting group (Pg) and then subjected to hydrogenation conditions including for example asymmetric hydrogenation to form a compound of formula 10d, which may be chiral (depending on hydrogenation conditions, i.e., asymmetric versus non-asymmetric hydrogenation). The compound of formula 10d or stereoisomer thereof, is reacted with a B-domain piece such as, for example,

10     4-chloro-D-phe to afford a BC piece (10e). The compound of formula 10e is then reacted with an A-domain piece to afford a compound of formula I. The details of the specific reaction steps are similar to or analogous to reactions taught herein, and in the experimental section. Furthermore, one of skill in the art is aware of that such intermediate reactions as hydrolysis and deprotection may be necessary to achieve optimum yields in certain steps of

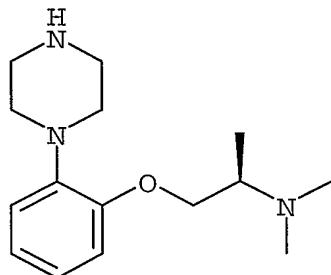

15     the scheme as shown. One of skill in the art is also aware of further common manipulations such as N-alkylation, or N-acylation, and alkylations on the benzene ring to afford other compounds of formula I.

The following describes the detailed examples of A Domain preparation.

5    C Domain Preparations:

The protected amino acid derivatives corresponding to the B and C domains are, in many cases, commercially available. Other protected amino acid derivatives can be prepared by following known literature method (See Williams, R. M. *Synthesis of Optically Active  $\alpha$ -Amino Acids*, Pergamon Press: Oxford, 1989). The following provides the  
10 preparation of C domains.

Preparation 1C

1-Methoxycarbonylmethyl-1,3-dihydro-isoindole-2-carboxylic acid tert-butyl ester

15    Step A: (2-Bromo-benzyl)-carbamic acid tert-butyl ester

To a mixture of 125.0 g (561.8 mmol) of 2-bromobenzylamine hydrochloride and 170.7 g (1236.0 mmol) of potassium carbonate in 300 mL of 50% THF/water was added 134.9 g (618.0 mmol) of di-*tert*-butyl dicarbonate in four portions over 20 minutes. The mixture was stirred at r.t. for about 16 hours and then diluted with 300 mL of ethyl acetate and 300 mL of water. The organic portion was separated and the aqueous portion was extracted three times with 200 mL each of ethyl acetate. The combined ethyl acetate portions were washed once with 250 mL of 10% aqueous sodium bisulfate. The organic portion was dried ( $MgSO_4$ ), filtered and concentrated to dryness to afford about 161 g of Step A compound.  
20

Step B: 3-[2-(tert-Butoxycarbonylamino-methyl)-phenyl]-acrylic acid methyl

25    ester

To compound of Step A (161.0 g, 561.8 mmol) in DMF (800 mL) was added methyl acrylate (58.0 g, 674.2 mmol), TEA (170.5 g, 1685.4 mmol) and dichlorobis(triphenylphosphine) palladium(II) (7.9 g, 11.2 mmol). The mixture was heated at 80°C for about 32 hours. The mixture was cooled, diluted with 1000 mL of EtOAc and washed with 10% aqueous sodium

-135-

5 bisulfate. The aqueous portion was extracted three times with EtOAc and the combined organics were dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated to dryness. The residue was dissolved in a small amount of DCM and filtered through 7 inches of silica gel in a 2 L sintered glass funnel eluting with 25% EtOAc/hexanes. The eluent was concentrated to dryness and recrystallized from EtOAc/hexanes to afford about 116.9 g (71%) of Step B compound.

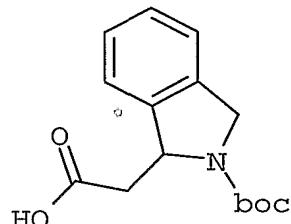

10 Step C: To a 0°C solution of (116.9 g, 401.2 mmol) material from Step B in DCM (800 mL) was added 200 mL of TFA dropwise over 15 minutes. After removing the cooling bath, the mixture was stirred for about 2.5 hours and then concentrated to dryness. The residue was dissolved in 500 mL of DCM and saturated aqueous sodium bicarbonate is slowly added until the mixture was slightly basic. The organic portion was separated and the  
15 aqueous portion is extracted two times with DCM. The combined organic portions were dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated to dryness. The residue was dissolved in 800 mL of DCM and DIPEA (57.0g, 441.4 mmol) was added. To the mixture was added di-*tert*-butyl dicarbonate (96.3 g, 441.4 mmol) in five portions over 45 minutes and then stirred at r.t. for 16 hours. The mixture was washed with 10% aqueous sodium bisulfate, and the organic  
20 portion was separated and the aqueous portion is extracted two times with DCM. The combined organic extracts were dried (( $\text{Na}_2\text{SO}_4$ ) and concentrated to dryness. The resulting residue was dissolved in a small amount of DCM and filtered through 7 inch silica gel in a 2L sintered glass funnel eluting with 25% EtOAc/hexanes. The eluent was concentrated to dryness and the enantiomers were separated by chiral chromatography. The first eluting  
25 isomer was labeled as isomer #1 and the second eluting is labeled as isomer #2, which afforded about 52.6g (45%) of the final compound (isomer 2). EIS-MS 292 [M+1].

**Step 1:** The HCl salt of H-D-p-Cl-Phe-OMe (35.8g, 129mmol) was dissolved

15 in water (200mL). Ethyl acetate (200mL) was added followed by addition of a saturated sodium bicarbonate solution. The mixture was stirred for about 5 minutes, and then the organic layer was separated, washed with water (200mL) and dried over magnesium sulfate. Step A: 3-(Methoxy-methyl-carbamoyl)-3,4-dihydro-1H isoquinoline-2-carboxylic acid tert-butyl ester

To Boc-D-1,2,3,4-tetrahydroisoquinoline carboxylic acid (14.9 g , 53.7mmol), in THF (500 mL), was added *N,O*-dimethylhydroxylamine hydrochloride (5.24 g, 53.7mmol), EDC (11.3g , 59.1mmol), HOBT (7.98g, 59.1mmol) and DIPEA (9.83ml, 56.4mmol). The mixture was stirred for about 16 hours at r.t. and under nitrogen, and then concentrated to dryness. The resulting residue was taken up in EtOAc, washed with 1M HCl, saturated sodium bicarbonate and brine, and then dried ( $\text{Na}_2\text{SO}_4$ ). After concentrating to dryness, the resulting residue was purified by flash chromatography ( $\text{SiO}_2$ , eluting with 1:1 EtOAc/hexane) to give about 12.3g (71%) of the ester. EIS-MS 321 [M+1]

Step B: 3-Formyl-3,4-dihydro-1H-isoquinoline-2-carboxylic acid tert-butyl ester

To a 0°C solution of material from Step A (1.28 g, 4.00mmol) in THF (30 mL) was slowly added 1.0 M LAH (in THF, 5.1ml, 5.1 mmol). The reaction mixture was stirred at 0°C for another 15 minutes. To the mixture was slowly added 20 mL of 5% aqueous potassium hydrogensulfate and the mixture extracted with  $\text{Et}_2\text{O}$  (2x). The combined organic portions were washed with 1M HCl, saturated sodium bicarbonate and brine, and then dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated to dryness affording 0.78 g (75%).

Preparation 5BC

Preparation of Lithium 2-[(2-tert-butoxycarbonyl-1,2,3,4-tetrahydro-isoquinolin-3-ylmethyl)-methyl-amino]-3-(4-chloro-phenyl)-propionate

10

Step A: To a solution of 3-[(2-(4-Chloro-phenyl)-1-methoxycarbonyl-ethylamino]-methyl]-3,4-dihydro-1H-isoquinoline-2-carboxylic acid tert-butyl ester from preparation 3BC Step C (0.60 gm, 1.31 mmol) in anhydrous methanol, was added sodium acetate (0.54 gm, 6.54 mmol). The solution was brought to pH 5-6 with 3-4 drops of glacial acetic acid. Aqueous formaldehyde (37% by wt., 0.49 mL) was added. The solution was put under a nitrogen atmosphere and cooled to 0°C. After about 15 minutes, sodium cyanoborohydride (0.25 gm, 3.92 mmol) was added and rinsed into the reaction with anhydrous methanol (5 mL). The mixture was stirred at r.t. overnight, and then concentrated in vacuo and reconstituted in aqueous sodium bicarbonate and ethyl acetate. After separation of phases, the aqueous phase was extracted with ethyl acetate (2X), and all organics were combined, dried (magnesium sulfate), filtered, and concentrated to an opaque white oil (0.64 gm). Chromatography (0 to 20% ethyl acetate in hexane) gave about 0.6 g of methylated product as a clear oil (97%). MS (m/z, ES+): 473.2.

Step B: A solution of LiOH.H<sub>2</sub>O (0.05 gm, 1.27 mmol) in distilled water (4 mL) was added to a solution of the material from Step A in 1,4-dioxane (8 mL), and the reaction was cooled slightly in an ice water bath. The mixture was stirred under a nitrogen atmosphere at r.t. overnight. An additional 1.5 eq. of LiOH.H<sub>2</sub>O (0.08 gm) were added as an aqueous solution (4 mL), and the mixture was stirred at r.t. over the weekend. The mixture

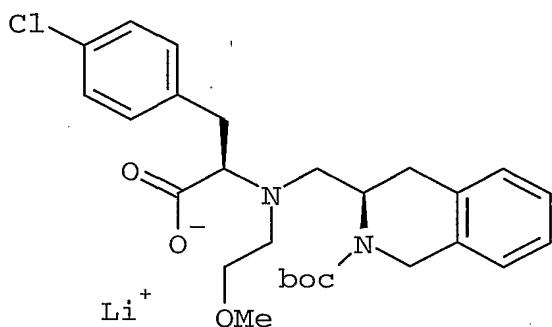

-154-

5 was concentrated, and then combined with THF and concentrated (3x) to help dry the material. The resulting foam was dried at r.t. overnight in a vacuum oven to give about 0.67 g of final compound as a white foam (11.4%). MS (m/z, ES+): 459.2

15

Step A: To a solution of methoxyacetaldehyde (0.15 gm, 2.03 mmol), 3-{[2-(4-Chloro-phenyl)-1-methoxycarbonyl-ethylamino]-methyl}-3,4-dihydro-1H-isoquinoline-2-carboxylic acid tert-butyl ester from preparation 3BC Step C (0.31 gm, 0.68 mmol) in acetonitrile was added sodium triacetoxyborohydride (0.72 gm, 3.38 mmol). After stirring overnight under a nitrogen atmosphere at r.t., additional acetaldehyde (0.25 gm) dissolved in acetonitrile and sodium triacetoxyborohydride (0.21 gm) was added, and the mixture was stirred for about 8.5 hours. The mixture was quenched at r.t. with 5N NaOH (5 mL). The aqueous phase was separated from the organic and extracted with ethyl acetate (4x). The combined organics were washed with a brine solution, and then dried, filtered and concentrated. Chromatography (gradient of ethyl acetate in hexane, 0 to 12%) gives about 0.23g of 3-{[[2-(4-Chloro-phenyl)-1-methoxycarbonyl-ethyl]-(2-methoxy-ethyl)-amino]-methyl}-3,4-dihydro-1H-isoquinoline-2-carboxylic acid tert-butyl ester as a yellow oil (70%). MS (m/z, ES+): 517.2.

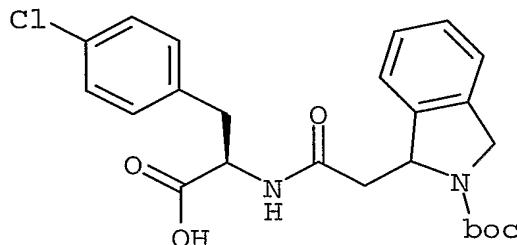

-155-

The mixture was stirred overnight at r.t. and then concentrated to a white residue. Addition of THF and concentration (3x) gives the lithium carboxylate as a foam. The foam was dried overnight under vacuum to afford about 0.25g of crude solids (109%). MS (m/z, ES+): 503.3

Purification by flash chromatography (10 g SiO<sub>2</sub>, linear gradient, 40 mL/minute, 0 to 10% MeOH/CH<sub>2</sub>Cl<sub>2</sub> over 25 minutes and 10% MeOH/CH<sub>2</sub>Cl<sub>2</sub> for 7 minutes) afforded boc-protected title compound (168 mg, 0.2 mmol, 98%).

Step 4: To a solution of boc-protected title compound (155 mg, 0.19 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (2 mL) was added TFA (2 mL) and DMS (0.25 mL). The mixture was stirred at r.t. for about 2 hours. The mixture was concentrated and purified using SCX (10 g) ion-exchange chromatography to afford final compound (121 mg, 0.16 mmol, 88%), which was converted to chloride salt by adding 1.0 M HCl in Et<sub>2</sub>O.

HRMS (electrospray) calculated for C<sub>35</sub>H<sub>43</sub>N<sub>5</sub>O<sub>3</sub>Cl: 616.3054. Found: 616.3073.

5 Preparation of Novel C-Domain Pieces

Heck Coupling:

Preparation PP1

10   Synthesis of Compound (2a) by a Heck Coupling of 2-bromobenzaldehyde (1a) with methyl acrylate (Pd(OAc)<sub>2</sub>/PPh<sub>3</sub> as the catalyst): A mixture of 2-bromobenzaldehyde (1a) (24.5 g, 132 mmol), methyl acrylate (17.9 mL, 199 mmol), Pd(OAc)<sub>2</sub> (590 mg, 2.65 mmol, 2 mol%), PPh<sub>3</sub> (1.39 g, 5.30 mmol, 4 mol%) and Et<sub>3</sub>N (46 mL, 331 mmol) was stirred at 80 °C for 15 h. Large amount of yellow solid was formed after the reaction was done. The mixture was cooled to rt, concentrated, and mixed with H<sub>2</sub>O (200 mL). The organic solid was collected by filtration, and then applied to a plug of silica gel (25 g) (EtOAc/hexane 1:1) to give a dark yellow solid. The solid was purified by crystallization (100 mL EtOAc bottom layer, 120 mL hexane top layer) to provide 17.57 g (70%) (100 % pure by NMR) of the first crop and 5.23 g (21%) (95% by NMR) of the second crop of 2a.

Preparation PP2

Synthesis of Compound (2a) by a Heck Coupling of 2-bromobenzaldehyde (1a) with Methyl Acrylate (R=H) ( $\text{Pd}(\text{OAc})_2/\text{P}(\text{O-Tolyl})_3$  as the catalyst): The compound 1a (9.998 g, 54.04 mmol) was dissolved in toluene (20 mL) at r.t. Methylacrylate (5.996 g, 69.65 mmol, 1.29 eq.),  $\text{NEt}_3$  (15 mL),  $\text{Pd}(\text{OAc})_2$  and  $\text{P}(\text{O-Tolyl})_3$  were successively added 10 and the mixture was stirred under reflux. After 2 hours, the reaction mixture was allowed to cool to RT. Then the precipitated yellow catalyst was removed by filtration. The catalyst was rinsed with toluene (2 X 10 mL) and the filtrates were concentrated to dryness under reduced pressure. The residual oil was dried under vacuum over the weekend to give a crude solid (11.449 g). The solid was taken-up with isopropanol (25 mL) and stirred overnight at 15 RT. Then, the precipitate was filtered and rinsed with isopropanol (5 mL). The wet cake (8.240 g) was dried overnight at RT affording the highly pure 2-carboxaldehyde-methyl-cinnamate with 74% yield (7.627 g, 40.1 mmol).

Preparation PP3

Heck Coupling of 1b and methyl acrylate to form 2b (R = 5-OMe): A mixture 20 of 2-bromo-5-methoxybenzaldehyde (1b) (4.5 g, 20.9 mmol, Aldrich), methyl acrylate (2.7 g, 1.5 eq, 2.83 mL),  $\text{Et}_3\text{N}$  (7.4 g, 3.5 eq, 10.2 mL),  $\text{Pd}(\text{OAc})_2$  (93 mg, 0.02 eq), and  $\text{P}(\text{O-Tol})_3$  was stirred and heated to 80°C over 2-3 days. The reaction mixture was cooled to r.t., partitioned between EtOAc (50 mL) and brine (50 mL). The aqueous was extracted with 25 EtOAc (2x50 mL). The combined organic was washed with brine (1x50 mL), dried over  $\text{MgSO}_4$ , filtered, concentrated to yield a yellow brown oil (5.01 g, 109 %). This crude oil was purified in a hot solvent Hex / EtOAc (80 mL/ 15 mL) to yield 2b as a pale yellow solid (3.5 g, 76 %).

#### Preparation PP4

Heck Coupling of 1c and Methyl Acrylate to Form 2c (R = 4,5-OMe): To a solution of 1c (906 mg, 3.70 mmol) in toluene (2 mL) was added Pd(OAc)<sub>2</sub> (17 mg, 0.074 mmol, 2 mol%), P(O-Tolyl)<sub>3</sub> (45 mg, 0.148 mmol, 4 mol%), methyl acrylate (0.5 mL, 5.55 mmol) and Et<sub>3</sub>N (1.5 mL, 11.1 mmol). The mixture was stirred at 80 °C for 21 h, cooled to 10 rt, and mixed with H<sub>2</sub>O (40 mL). The organic compounds were extracted with EtOAc (50 mL), washed with brine (40 mL), dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated. The residue was purified by flash chromatography to provide 466 mg (47%) of recovered 1c followed by 450 mg (49%) of 2c (4,5-Ome).

15

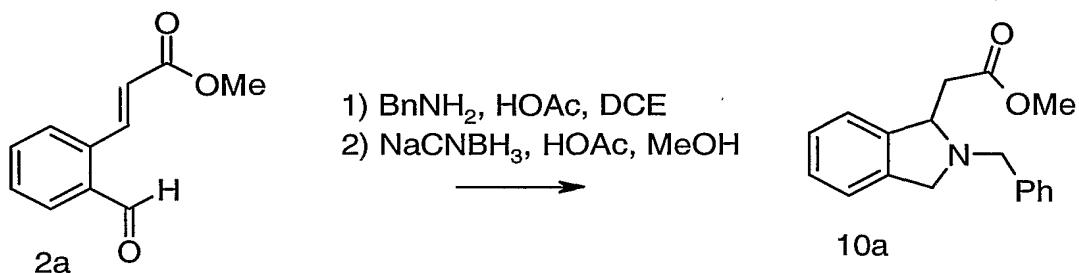

#### Preparation PP5

Heck Coupling of 1d and Methyl Acrylate to Form 2d (R = 5-NO<sub>2</sub>): The procedure is same as that of 2c, yielding 82% of 2d after purification.

Reductive amination of (2a) with benzyl amine to form isoindoline (10a). To a solution of 2a (11.27 g, 59.2 mmol) in ClCH<sub>2</sub>CH<sub>2</sub>Cl (60 mL) was added BnNH<sub>2</sub> (6.47 mL, 59.2 mmol), followed by HOAc (5.1 mL, 89 mmol). The mixture was stirred at rt for 1 h. NaCNBH<sub>3</sub> (5.58 g, 88.8 mmol) and MeOH (30 mL) were then added to the above solution. The resulting mixture was stirred at rt for another 2 h and quenched with sat. NaHCO<sub>3</sub> solution (150 mL). The mixture was extracted with EtOAc (2 × 100 mL) and the combined

One-pot process from 2-carboxaldehyde-methyl-cinnamate to target cyclized isoindoline product using  $\text{NaBH}_3\text{CN}$ . 2-carboxaldehyde-methyl-cinnamate 2a (3.254 g, 17.1 mmol) was dissolved in a 1:1 MeOH:  $\text{PhCH}_3$  mixture (20 mL) at RT. R-(+)-phenethylamine (2.073 g, 17.1 mmol) was added and the solution was heated under reflux for 2 hours. HPLC 15 in process control indicated that the imine formation was completed. Then, AcOH (2.055 g, 34.2 mmol) and  $\text{NaBH}_3\text{CN}$  (2.15 g, 34.2 mmol) were successively added at RT, the reaction mixture being cooled with a water-bath. The reaction mixture was post-agitated overnight. Water (10 mL), MeOH (20 mL) and 37% HCl (2.8 mL) were successively added and the 20 organic layer was extracted. The aqueous layer was washed with  $\text{PhCH}_3$  (10 mL). Then, the aqueous layer was made basic with 5N NaOH (20 mL) and MeOH was concentrated to partly remove MeOH. Extraction with EtOAc (2X 25 mL) was performed. The combined organic layers were dried over  $\text{MgSO}_4$ , filtered and rinsed with EtOAc (10 mL). The filtrates were concentrated under reduced pressure and the residual oil was dried under vacuum overnight at RT to afford the target cyclized isoindoline product 10b with 92% yield (4.642 g, 15.7 mmol). HPLC % area indicated that the 2 diastereomers were produced in a 55:45 ratio.  $^1\text{H}$  NMR confirmed this result by integration of the methyl group of the phenethyl substituent.

5 Note: The Heck or Heck-type coupling was performed in toluene with a slight excess of methylacrylate which was removed by distillation before the MeOH and the R-(+)-phenethylamine addition.

Preparation PP8

The mixture was stirred at rt overnight, quenched with sat. NaHCO<sub>3</sub> solution (20 mL) and extracted with EtOAc (2 × 30 mL). The combined organic layers were washed with brine (30 mL), dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated. The residue was purified by flash chromatography (hexane/EtOAc 3:1) to provide 317 mg (87%) of 11a.

The compound of  $\alpha$ -Methyl benzylamine was applied as the auxiliary. As shown above, the one-pot reaction of aldehyde **2a** and  $\alpha$ -Methyl benzylamine gave 90% of **10b** with a ratio of 1.2:1.

Step-wise reduction, amination, and cyclization:

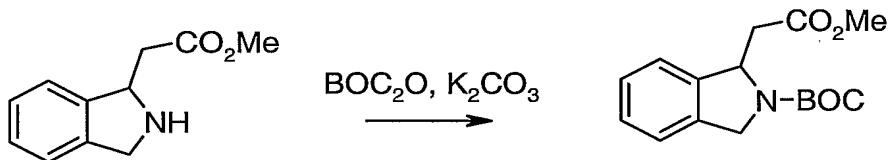

Condensation of aldehyde 2a with  $\alpha$ -methylbenzylamine in acetonitrile, methanol, methanol/toluene(1:1) or toluene afforded imine 9 in excellent yield. Reduction of the imine was initially carried out at RT with NaCNBH<sub>3</sub>/HOAc. As a result, a poor ee ratio (1.2:1) was obtained, similarly to the previous described one-pot procedure. But when the reaction was 10 carried out with NaBH<sub>4</sub>/TFA at RT, the ratio was elevated to 2:1. By lowering the reaction temperature to -78°C, the ratio was increased to 5 to 6:1.

Preparation PP14

Cyclization of *t*-Butyl carbamate (11a): The *N*-Boc isoindoline methyl ester 12 was 15 originally synthesized from 11a via deprotection of Boc with TFA, followed by basic workup, and protection with a Boc group. This procedure has been greatly improved by a one-step procedure.

In a 3 L 3-neck round bottom flask equipped with a nitrogen inlet, thermocouple and mechanical stirrer, a solution of 160 g (1.15 moles) of K<sub>2</sub>CO<sub>3</sub> in 180 mL 25 of water was stirred at rt. Solid BOC anhydride 120 g (0.55 moles) was added in one portion forming a semi-solution. To the reaction mixture, a solution of the crude amino ester starting material, 87 g (0.46 moles) in 120 mL of THF was added slowly at such a rate to keep the internal temperature below 35°C. A mild effervescence was observed. The reaction mixture was stirred for 18 hours at rt. Analysis of a reaction aliquot via NMR (DMSO<sub>6</sub>) indicates the 30 desired product. The reaction was diluted with brine and the product extracted with EtOAc.

In a 3-L 3-neck round bottom flask equipped with a mechanical stirrer, thermocouple, and reflux condenser, a solution of 150 g (approx. 0.46 moles) of crude N-BOC ester starting material in 750 mL of methanol was stirred at rt. To the solution, 750 mL of water was added and the cloudy mixture was stirred vigorously. Solid LiOH 25 g (1.03 moles) was added in small portions at such a rate to maintain the internal temperature below 45 °C. Upon completion of addition, the reaction was stirred overnight at rt becoming a dark green color. After 18 hours the reaction was concentrated to yield a thick semisolid. The crude product was dissolved in EtOAc and washed with 1 N HCl quickly, followed by two brine washes. The organic layer was dried with  $\text{Na}_2\text{SO}_4$ , filtered and concentrated to yield 81 g of a dark green solid. The aqueous layers were combined and back extracted with methylene chloride, dried over  $\text{Na}_2\text{SO}_4$ , filtered, and concentrated to yield 6 g of a dark green solid. Both solids were combined to yield 87 g of desired product confirmed via NMR ( $\text{DMSO}_6$ ).

The imine 9 (1.412 g, 4.81 mmol) was dissolved in anhydrous THF (10 mL) at RT and TFA (5 mL) was added. The black solution was then cooled to -78°C (dry ice bath) and NaBH<sub>4</sub> (0.893 g, 23.6 mmol, 5 eq.) was added in 2 portions over 5 minutes. Then, the reaction mixture was post-agitated at -78°C for 3 hours and allowed to gently warm at RT overnight. Water (20 mL), cyclohexane (10 mL) and EtOH (20 mL) were successively added and the organic layer was extracted and discarded. The aqueous layer was made basic with 5N NaOH (20 mL) and extracted two times with a 2:1 EtOAc/PhCH<sub>3</sub> mixture (30 mL).

15 N-Boc methyl ester 11a (36.3 g, 0.125 mol) was dissolved in THF (250 mL),

Hydrogenolysis of 10a (R = Bn) to Form (14a): To a solution of crude 10a (15.3 g, 54.4 mmol) in MeOH (100 mL) was added Pd(OH)<sub>2</sub>/C (Pearlman's catalyst, 1.02 g, 20 6 mol%) in a par-shaker bottle. The suspension was shaken under 30 psi H<sub>2</sub> pressure overnight in the par-shaker, and filtered through a plug of celite. Preparation PP23

In a typical reaction a mixture of the isoindoline ester 12a (92 mg, 0.316 mmol) in 1:1 MeOH/H<sub>2</sub>O (2 ml) was treated with LiOH (15 mg, 2 eq) at RT overnight. Diluted the mixture with CH<sub>2</sub>Cl<sub>2</sub> (5 ml) and water (5 ml). Adjusted the pH of the reaction mixture to 1-3 with a 10% NaHSO<sub>4</sub> solution. Separated the layers. The aqueous was extracted with CH<sub>2</sub>Cl<sub>2</sub> (1 x 10 ml). The combined organic was dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, concentrated to yield 16a as a pale yellow foam (76 mg, 87 %). NMR (CDCl<sub>3</sub>) showed a clean desired acid product.

It is noted that the reaction time must be more than 6 hours. The crude foam can be purified by slurry in warm hexane and then filter to yield a tan solid. Hydrolysis using KOH (2-5 eq) in 1:1 MeOH/H<sub>2</sub>O overnight would give the same result.

## 5 Asymmetric Hydrogenation Routes

#### Part I: Synthesis of the Z-isomer (precursor of asymmetric hydrogenation)

### Scheme P1

## Preparation PP27

Z-isomer 5 was synthesized as outlined in Scheme P1. Compound 5 was shown to be a single isomer by HPLC and H-1 nmr. The double bond stereochemistry was derived from comparative NOE data using the purported E-isomer (Scheme P1). The best chiral induction was achieved using compound 8/Ferrotane/MeOH-THF. With regard to the conversion of 9 to 10, which would constitute a formal asymmetric synthesis of isoindolene 10, this has been achieved using Super hydride-BF<sub>3</sub>.OEt<sub>2</sub>. However, the product was a mixture of 10 and the corresponding de-BOC (deprotected) compound.

Compound 2 (scheme P1)

Phthalic anhydride (751.5g, 5.014 mole), potassium acetate (498g, 5.014 mole) and acetic anhydride (1L) were stirred together under nitrogen. The mixture was slowly warmed to 145-150<sup>0</sup>C and stirred for 10 minutes, then at 140<sup>0</sup>C for 20 minutes. The  
10 mixture was allowed to slowly cool to 80<sup>0</sup>C over 1 hour. Three volumes of water were added causing precipitation of a solid. After filtration, the filtered solid was washed with warm water and pulled as dry as possible for 30 minutes. The solid was then washed with ethanol and acetone respectively. If required further purification could be achieved by slurring the solid in acetone, at room temperature, for 15 minutes, then filtration. Drying in vacuo at

Compound 3 (Scheme P1)

20 Compound 2 (470g, 2.47 mole) was added to stirred aqueous ammonia (470 ml conc. NH<sub>3</sub> in 4.7L water). The resultant mixture was stirred at room temperature for 1 hour then filtered. The filtered solid was washed with water. The combined aqueous filtrate and washings were carefully acidified with 6M aq. HCl (2.35L). H-1 NMR analysis indicated approx. 80% conversion to acid chloride). DMF (3.7ml) was added and the mixture refluxed an additional 3 hours. The resultant mixture was allowed to cool to 35<sup>0</sup>C and methanol (1.27L) added at such a rate that

Compound 4 (750g, 3.65 mole) was dissolved in acetonitrile (15L). The stirred mixture was cooled to 0-5<sup>0</sup>C and DMAP (624g, 5.11 mole) added in one portion. After 10 minutes BOC anhydride (1115g, 5.11 mole) was added in one portion: there was a slight exotherm accompanied by gas evolution. The mixture was stirred at room temperature  
15 for 5 hours, and then concentrated in vacuo. The residue was dissolved in EtOAc and washed with 10% aqueous citric acid, satd. aq. Na<sub>2</sub>CO<sub>3</sub> and water respectively. After drying, concentration of the organics gave a thick syrup. This material was run through a plug of silica gel (1.5kg) eluting with 1:1 EtOAc-hexane.  10 thermocouple, and reflux condenser placed on top of a Soxhlet extractor charged with 4 °A sieves, a semi-solution of *m*-tyrosine ethyl ester hydrochloride 1288 g (5.26 moles) in 13 L of acetone was heated to reflux temperature. The condensate was filtered through the sieves to remove water. The reaction was stirred vigorously at reflux for 48 hrs. An NMR sample in DMSO<sub>d</sub><sub>6</sub> indicated the absence of starting material. The reaction was cooled to r.t. and  
 15 concentrated to yield an off-white solid, 1411 g (94%).

Preparation PP43

Step 3: Triflation

20

In a 22 L 4 neck round bottom flask equipped with a reflux condenser,  
 mechanical stirrer, nitrogen inlet, and a thermocouple, 1240 g (4.35 moles) of the starting  
 material salt in 12.4 L of methylene chloride was cooled to 4 °C. To the mixture, 1452 mL  
 25 (10.4 moles) of triethylamine were added and stirred into solution. Triflic anhydride, 1472 mL (5.22 moles) was added dropwise to the reaction at such a rate to maintain the internal  
 temperature below 10 °C. The ice bath was removed and the reaction warmed to rt. and  
 stirred for 18 hrs. The reaction was concentrated to a oil then dissolved in 4 L of EtOAc and

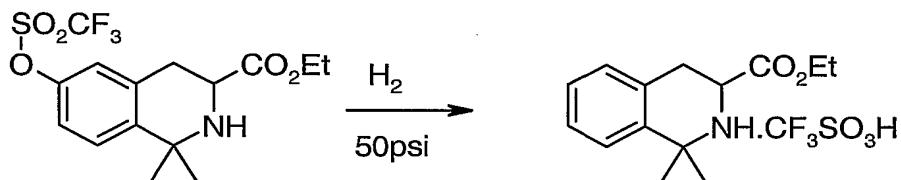

-223-

5 concentrated again to an oil in an effort to remove excess triflic anhydride. The crude residue was dissolved in 4 L of EtOAc and washed with water and saturated sodium bicarbonate solution. The organic layer was isolated and dried with sodium sulfate, filtered and concentrated to yield 1720 g (>100%) of a crude dark oil which was used without further purification.

10

Preparation PP44

Step 4: Deoxygenation

15

A solution of 1720 g (4.35 moles) of crude starting material in 14 L of acetone was charged to a 10 gallon stainless steel autoclave. To the solution, a slurry of 5% Pd/C in 1.2 L of toluene was added. The reaction mixture was evacuated and purged with H<sub>2</sub> gas at 50 psi two times. The reaction was stirred overnight at 50 °C with H<sub>2</sub> at 50 psi. A sample aliquot indicated no reaction had occurred. The mixture was filtered and concentrated to a thick oil and resubjected to reaction conditions. After 18 hrs, NMR of a sample aliquot indicated absence of starting material. The reaction mixture was filtered and the filtrate concentrated to yield 1581 g of an off-white solid (95%).

Preparation PP45

Step 5: Hydrolysis/Salt Formation

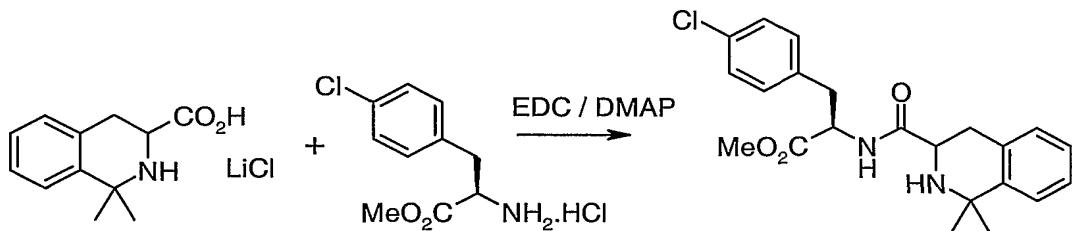

To a 2 L 3 neck round bottom flask equipped with a mechanical stirrer, thermocouple, and nitrogen inlet, a mixture of 700 g (1.83 moles) of the triflate salt starting material was charged. A solution of 427 g (1.83 moles) of the starting material free base in 13.3 L of THF was added followed by 700 mL of water. The semi-solution was stirred vigorously at r.t. To the reaction flask, 43.7 g (1.83 moles) of solid LiOH were added in small portions at such a rate to maintain the internal temperature below 35 °C. The reaction was stirred for 18 hrs at r.t. and concentrated to yield a thick oil. THF (4 L) was added and the semi-solution was concentrated. This was repeated with toluene and the semi-solid was placed under house vacuum on the roto vap with stirring for 18 hrs to yield 650 g of a crude solid. The solid was reslurried in EtOAc, filtered, isolated and dried to yield 525 g (68%) of the lithium salt as an off-white solid.

20

Preparation PP46

Step 6: Coupling

25

Solid *d*-chloro-phenylalanine 446 g (1.78 moles) was added to the semi-solution followed by 20 g (0.162 moles) of DMAP. The resulting mixture was stirred for 15 minutes then solid EDCI (1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride)

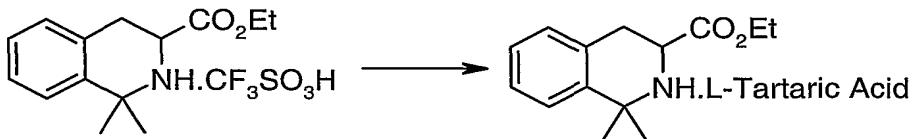

-225-

5    390 g (2.03 moles) was added. The reaction mixture was heated to 80 °C and stirred for 18 hours. Thin layer chromatography (1:1 EtOAc:Hex) indicated very little starting material present. The reaction was cooled to r.t. and concentrated to yield a thick oil. The crude oil was dissolved in EtOAc and washed with water, and brine. The solution was dried with sodium sulfate, filtered and concentrated to yield a thick oil, 426 g. The crude oil was  
 10 chromatographed in several lots using a Waters Prep 500 chromatography apparatus. The eluent consisted of a gradient system, 5%-80% EtOAc in heptane at a flow rate of 240 ml/min over 38 minutes. The two diasteromers were separated and isolated to yield 119.04 g for the top spot and 111.3 g for the bottom spot. Conformation of both desired diastereomers was achieved via NMR (DMSO<sub>6</sub>).

dehydroabietylamine salt: Racemic 2-{2-[(tert-butyl)oxycarbonyl]-1,2,3,4-tetrahydroisoquinolyl}acetic acid (30.15 g, 103.5 mmol) was dissolved in *i*-PA (300 mL).

Dehydroabietylamine (22.11 g, 52.7 mmol of a 68 weight % mixture) was added to the solution, which was then agitated on a multi-arm shaker for 63 h. The resultant thick paste was filtered and rinsed with *i*-PA (50 mL, 25 mL). Dried in a 50 °C vacuum oven to obtain a white solid (27.73 g, 52 % ee by chiral CE analysis). The product was reslurried in *i*-PA (266 mL) and agitated on a multi-arm shaker for 23.5 h. Filtered the thick slurry and rinsed with cold *i*-PA (50 mL, 30 mL). Dried the cake in a 50 °C vacuum oven and obtained the product as a white solid (23.63 g, 40 % yield, 94 % ee by chiral CE analysis).

Scheme P6

Asymmetric Hydrogenation:

10

Preparation PP49

Enamine 21 (Scheme P6) was prepared as a substrate for asymmetric hydrogenation screening studies. It is formed as an approx. 10:1 mixture with imine 22. The enamine (21) may be NH-protected i.e., by a Boc protecting group. The resulting compound 15 23 may be subjected to asymmetric hydrogenation to afford the acetic acid or methylacetate substituted isoquinoline, which may be processed into a compound of formula I as demonstrated previously.

10     Synthesis of Gem-dimethyl TIC:

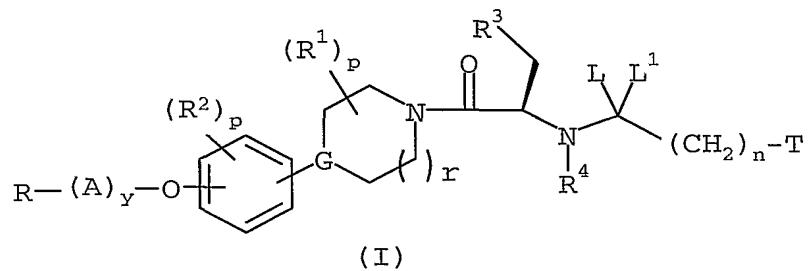

Preparation PP51

15     The chiral synthesis of gem-dimethyl TIC using L-Dopa as the starting material instead of tyrosine was successfully demonstrated up to the Pictet-Spengler reaction with L-DOPA and acetone. The product is a mixture of starting material 24 and product 25 (major component). The product was isolated by using common isolation procedures. An alternative isolation method is to react the mixture (24 and 25) with BOC anhydride wherein  
20     the less hindered N-H in 24 leads to preferential BOC protection of 24, allowing for ready separation of 25. Chemistry for the rest of the sequence i.e., deoxygenation reaction, has been demonstrated herein.
